

Tips for Proper Printing

- The printer dialog boxes shown on the following pages are intended to illustrate some key concepts to make printing our downloadable design rings easier for you, and to ensure that they fit and look great inside your Trim-A-Rim ("T-A-R") or Mini Trim-A-Rim ("Mini T-A-R").
- However, all printers are different so your printer dialog boxes will probably look
 different than those shown here. The navigation between boxes will also vary. Please
 consult your user manual or your printer maker's customer support for questions which are
 specific to your particular printer.
- Which quality/weight of paper to use? For the best possible appearance, durability, ease of trimming and fit, we recommend paper that is higher than 20lb weight, but not as thick/ stiff as cardstock, and with a high brightness rating (96+). "Cheap" copy paper, which is typically labeled as 20lb (weight or thickness), with brightness ratings in the 80s or low 90s, will work, but the colors in your design will not appear as bright, and the ring can tear or get tattered more easily. Instead, look for widely available 22lb or 24lb letter-size paper (or 26lb to 30lb 11" x 17" paper if using a large format printer), with a brightness rating of 96 or higher. The better quality your paper is, the happier you'll be with your results.
- Check before you cut: To save you time, it is always a good idea to lay one of the already cut rings from the T-A-R or Mini T-A-R box on top of your ring print-out to do a size comparison, so that you will know if your print-out is properly sized before cutting it out.

Print * Check the Size Against a Pre-Cut Ring * Trim Carefully * Place Inside Your T-A-R or Mini T-A-R and ENJOY!
